

DDC: direction reverses externally and marker adjustment attenuates the association

Marker-score adjusted log HR = -0.205 (FDR 0.118); direct purity changes the matched coefficient by 0.002

A Cross-cohort estimates with 95% CIs

B TCGA adjustment sensitivity (coefficients only)

A: TCGA adjusted model; external expression-only models. GSE29609: n = 39, 17 deaths.

B: Marker-score coefficients have no stored CIs; dots do not imply equal precision. Direct purity and marker scores address different threats. Normal-tissue atlas cell-source context is descriptive and cannot establish the source of tumor expression.
